

Update on South Central Fresno Community Air Monitoring

South Central Fresno CSC
November 30, 2022

CAMP Fully Deployed

**PM2.5
Monitor**

Compact System: PM2.5, Black Carbon, Ozone, BTEX, NOx, VOC, CO (Edison), Toxics (Edison), SO2 (West Fresno)

**Regulatory Air
Monitor:** Foundry (PM2.5), Drummond (Ozone, NO2, PM10)

Trailer: PM2.5, Black Carbon, Ozone, CO, NO2/NO, H2S/SO2, BTEX

Mobile Monitoring

Van: respond to community concern

Community Air Monitoring Platforms

Community Air Monitoring Platforms (cont'd)

Community Air Monitoring Platforms (cont'd)

Ongoing Community Air Monitoring

- District continuing to conduct localized air monitoring in the South Central Fresno community
- Fully deployed air monitoring platforms across the community, according to Community Steering Committee recommended network design
- Air monitoring van actively being used to regularly monitor pollutants in areas of interest of the community
- Extensive PM_{2.5} and VOC speciation sampling and laboratory analysis being conducted since late 2019
- Continue to seek input from CSC for suggestions

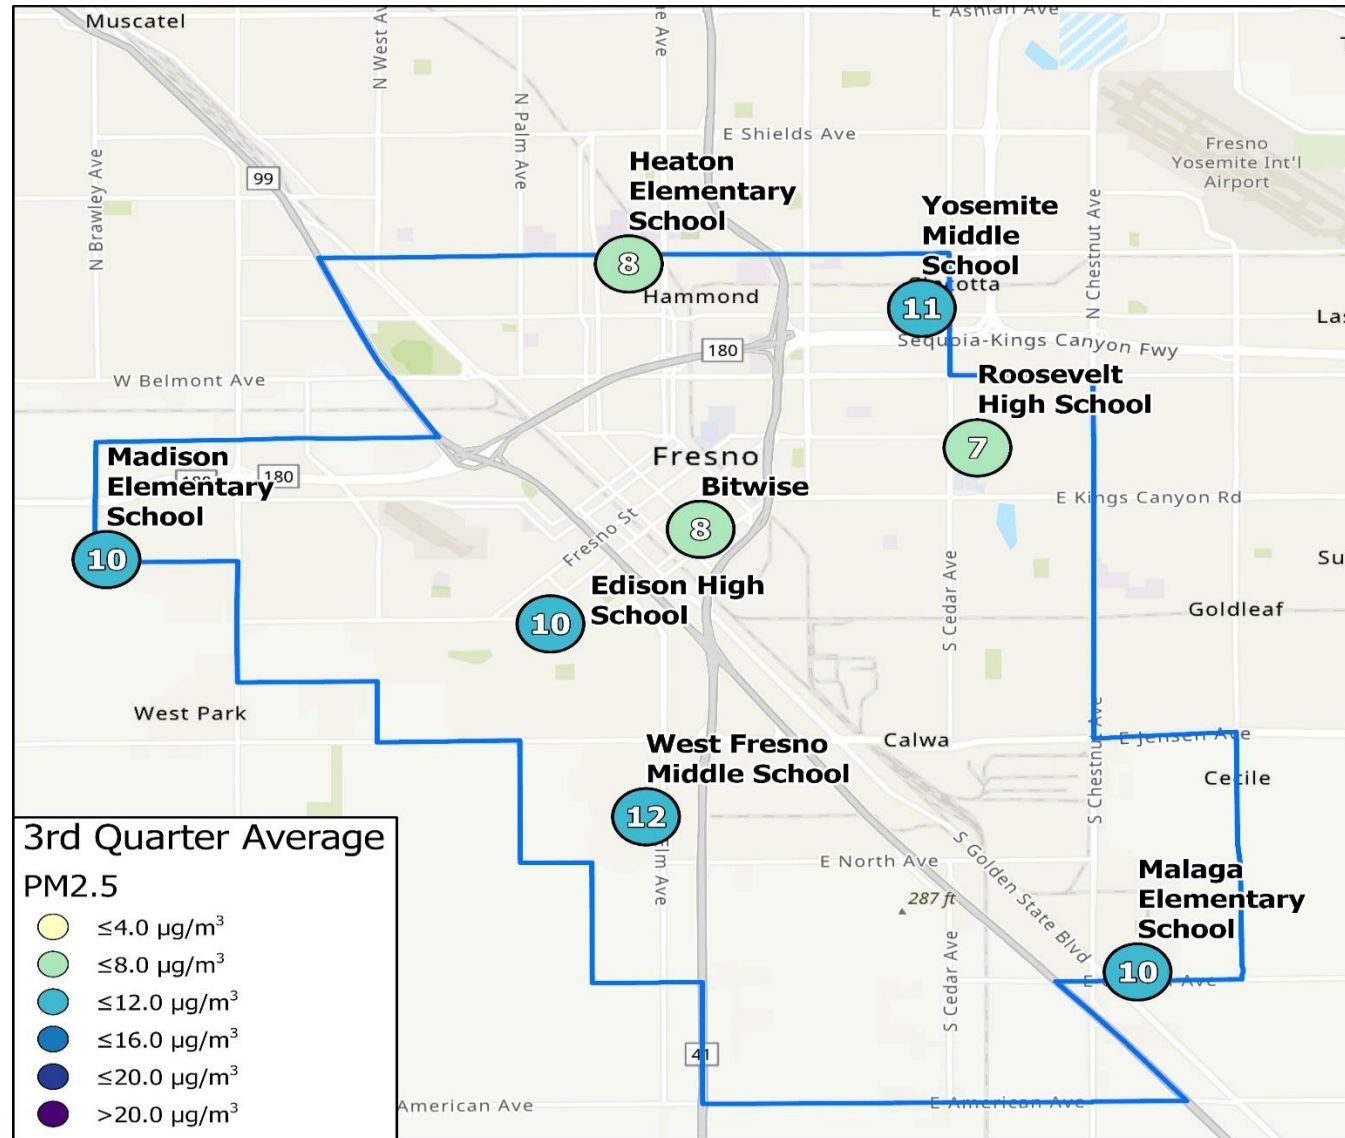

CSC Comments from the July Meeting

Comments/Questions from July CSC	
1	Presentation of speciation data using chemical names and not using acronyms <i>(Updated in this presentation)</i>
2	Additional analysis of PM2.5 air monitoring data (e.g., number of days when the concentrations exceeded air quality standard, comparisons with regulatory monitoring data) <i>(Updated in this presentation)</i>
3	Is there a way to distinguish the contributions from different biomass burning sources? <i>(Can determine that PM2.5 emissions are from wood burning but cannot determine source, i.e. residential wood burning or wildfire)</i>
4	Do the air toxics threshold levels consider both adults and children? <i>(District coordinating with OEHHA and CARB to clarify)</i>
5	What pesticide monitoring is planned for community? <i>(There is an action item that states “The air district will bring the department of pesticide regulation into the conversation with the Community Steering Committee with regards to air quality monitoring.”)</i>
6	Monitoring outside of the community, near N. Parkway Dr. and W. Olive Ave <i>(Checked with City of Fresno and no current renovation work at nearby motels; will monitor with van when/if construction takes place)</i>

Annual Average PM2.5 Comparison

Moderate
Good

Direction of PM2.5 at Edison High School (2022 YTD)

Site: Fresno_Edison
Parameter: PM2.5
Units: UG/M3

Period: 1/1/2022-9/30/2022

- PM2.5 most often coming from the from the Northwest
- District working to explore possible sources this winter, with better speciation and nighttime surveillance

Direction of PM2.5 at West Fresno (2022 YTD)

Site: Fresno, West Fresno
Parameter: PM2.5
Units: UG/M3

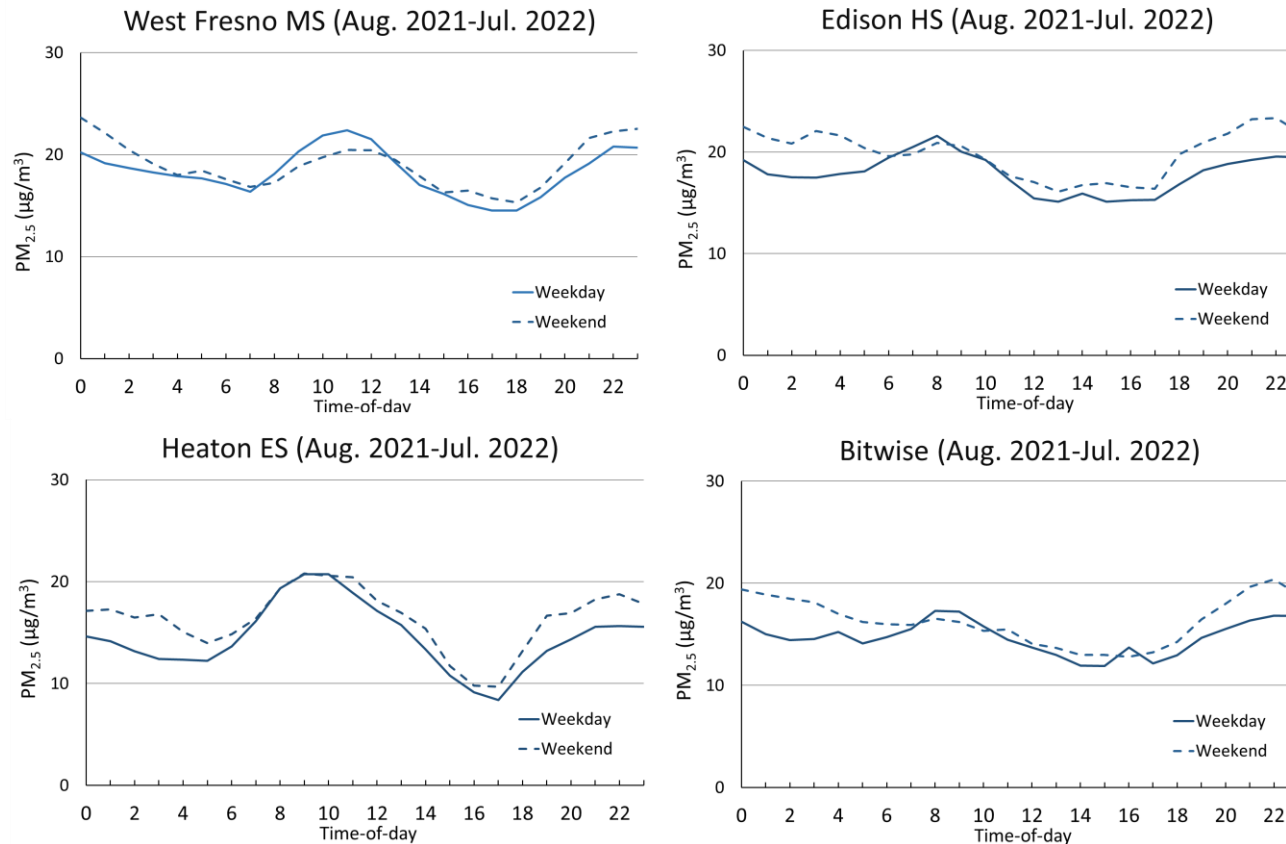

Period: 1/1/2022-9/30/2022

- PM2.5 most often coming from the from the West
- District working to explore possible sources this winter, with nighttime surveillance

Variations of PM_{2.5} During the Day (Yearly Data)

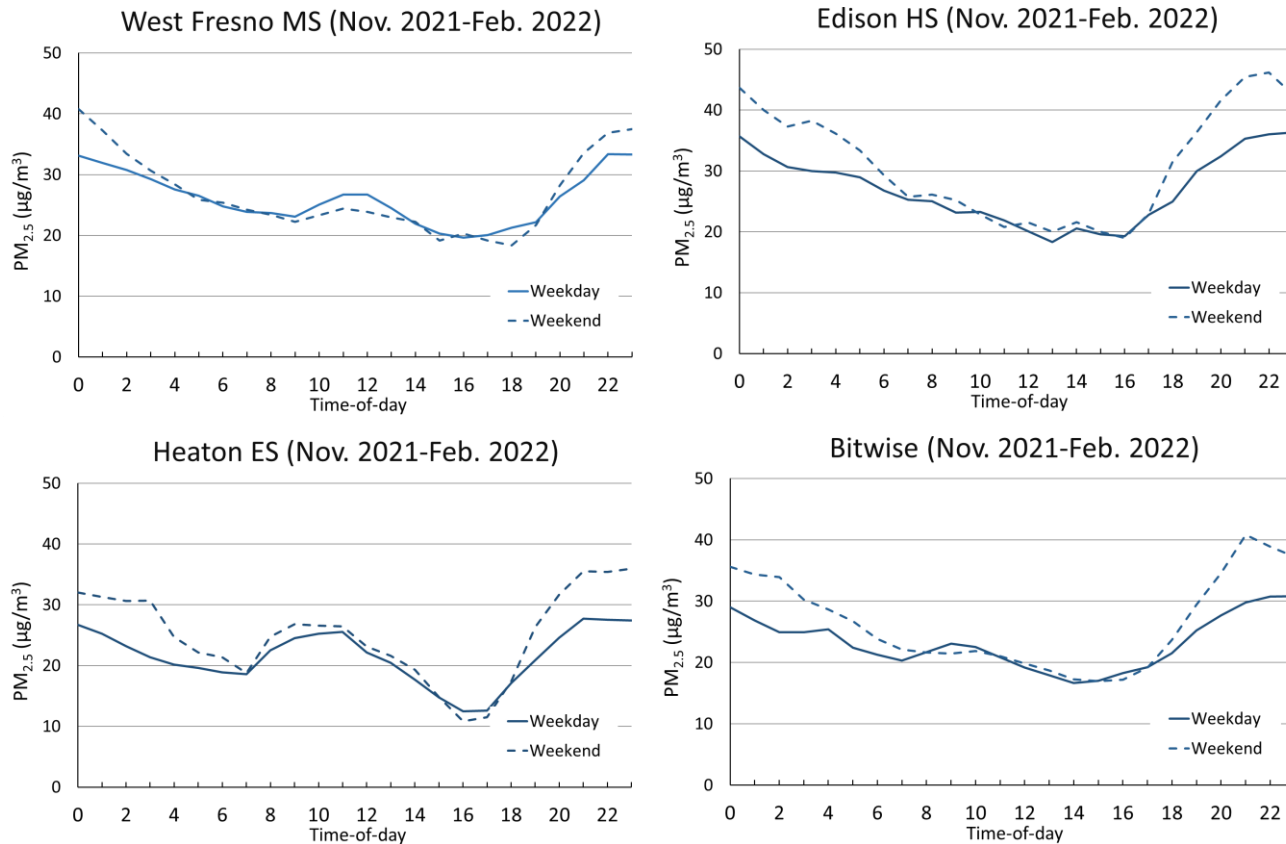

August 2021 – July 2022

- Data analyzed for West Fresno Middle School, Edison High School, Heaton Elementary School and Bitwise
- General patterns:
 - Two peaks at all four sites: morning (8:00 – 11:00) and nighttime (after 18:00 – 20:00)
 - Low concentrations in the afternoon (lowest at Heaton ES)
- Weekday vs. weekend:
 - Higher morning peaks at West Fresno MS and Bitwise on weekdays
 - Higher nighttime concentrations at all four sites on weekends
- General patterns are similar to those at other locations

Variations of PM_{2.5} During the Day (Winter Data)

2021-2022 Winter (November 2021 – February 2022)

- Data analyzed for the same four sites
- General patterns:
 - Morning peaks at West Fresno MS, Heaton ES and Bitwise
 - No morning peak at Edison HS
 - Nighttime peaks at all four sites
 - Low concentrations in the afternoon (lowest at Heaton ES)
- Weekday vs. weekend:
 - Higher morning peaks at West Fresno MS and Bitwise on weekdays
 - Much higher nighttime concentrations at all four sites on weekends

Types of PM2.5 at Edison High School

March – August 2022

Ammonium Nitrate:

- Formed in atmosphere (not emitted) from emissions of nitrogen oxides (NO_x), which is mostly from mobile sources.

Ammonium Sulfate:

- Formed in atmosphere (not emitted) from emissions of sulfur oxide (SO_x) from mobile sources and industrial processes.

Organic carbon:

- **Directly Emitted:** combustion including cooking, industrial processes, mobile source exhaust, tire wear, and wood burning
- **Formed in Atmosphere:** from wood burning, solvent use, and industrial processes.

BC or Elemental Carbon:

- Directly emitted, also known as soot or black carbon, and is formed during incomplete combustion in fuels, including mobile exhaust (mainly diesel) and wood burning.

Soil:

- Road dust and soil dust that are entrained in the air from activity, such as soil disturbance or airflow from traffic.

Other Metals:

- Components from soil emissions or found in other particulates having been emitted in connection with combustion from engine wear, brake wear, and similar processes. Also fireworks.

Types of PM2.5 at Edison High School

March – August 2022

- Began collection of air samples in March 2022 to help assess potential sources of elevated PM2.5
- Lower PM2.5 concentrations recorded during this period: no exceedances of $35 \mu\text{g}/\text{m}^3$
- March – August Edison average similar to all other sites
- Planning to continue speciation monitoring and analysis through 2022-2023 winter season to observe potential differences

NEXT STEPS

New lab contract already in place to better analyze Organic Carbon in PM2.5 samples at Edison

“Levoglucosan” will be tested, which can be used to understand if PM2.5 is coming from burning wood

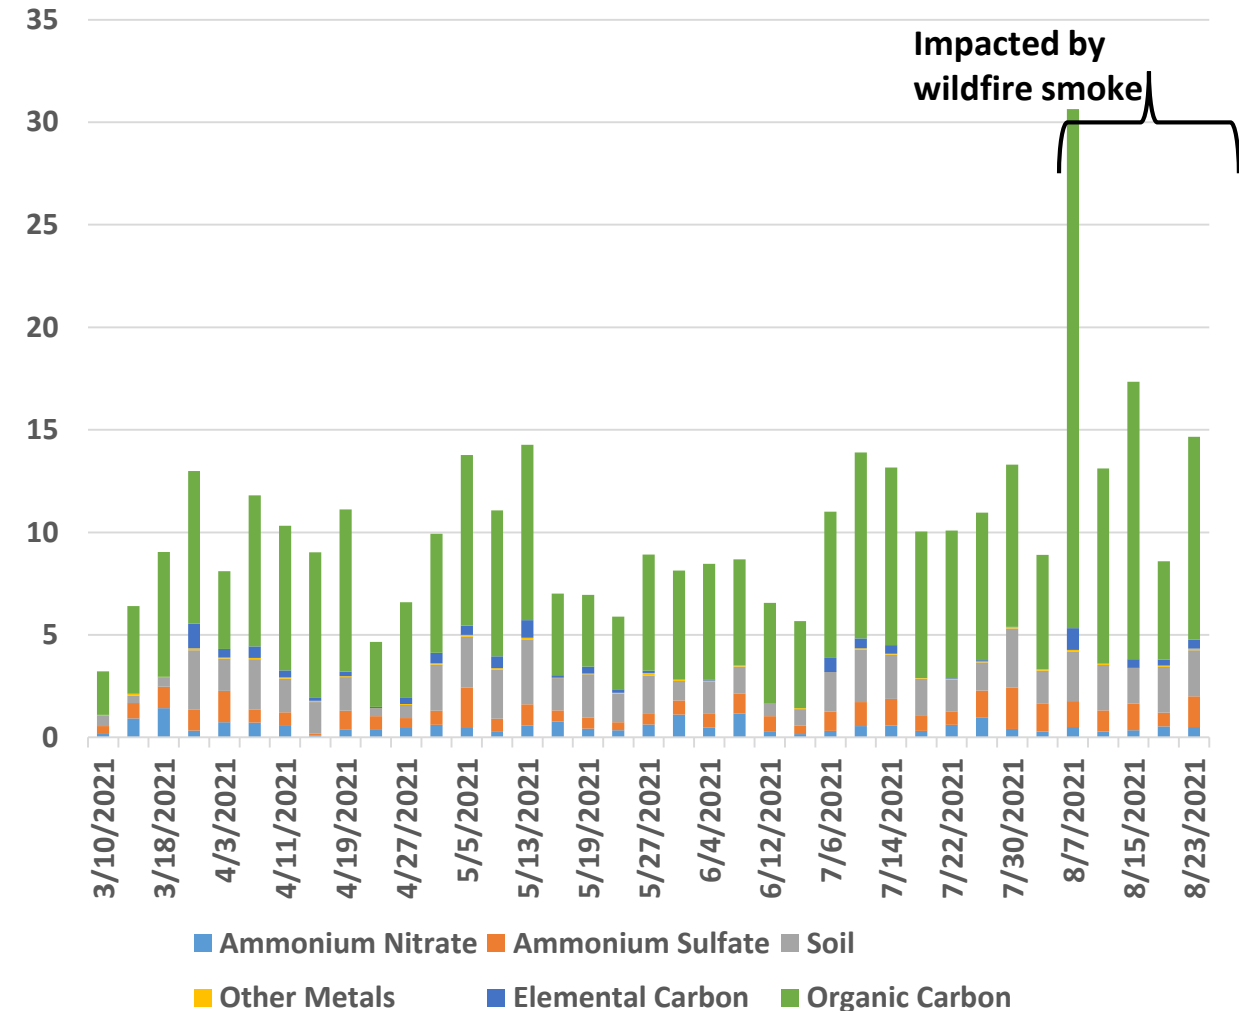

■ Ammonium Nitrate ■ Ammonium Sulfate
■ Soil ■ Other Metals
■ Elemental Carbon ■ Organic Carbon

Types of PM2.5 Comparison

Edison High School (2022)

Malaga Elementary School (2021)

What is source apportionment analysis?

Simply Put:

It is an estimate of “how much of what comes from which source”

In Other Words:

Measurements of air pollutants can tell us about the types of sources that affected the air quality at the location where the measurements were made

What does it take to do this analysis?

First, we need to collect the air quality data:

- Where we collect the air quality data matters
- Different air pollutants can tell us about different sources
- Frequency and duration of the measurements will improve the results
- Accuracy of measurement is very important

Second, we start the source apportionment analysis:

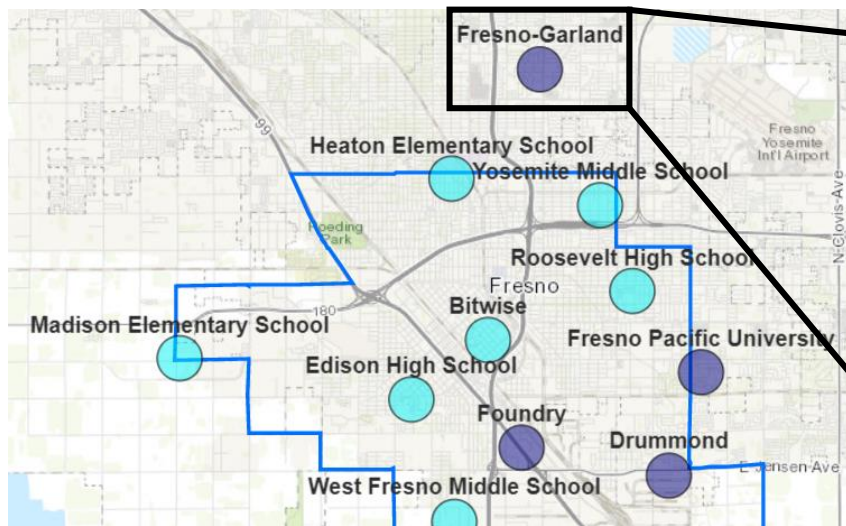

- Clean up the air quality data used for analysis
- Optimize the performance of the source apportionment analysis
- Do other data analysis to support the results with science (e.g., How did the meteorology affect the data?)

An example of source apportionment study

What: Research to study the sources of $\text{PM}_{2.5}$ at Fresno (Zhang, UC Davis)

When: Oct 2018 – May 2019

How: Measured the components that make up $\text{PM}_{2.5}$ every hour for two years
